

PRODUCT REQUIREMENTS DOCUMENT

Rehamo.com Digital Lead Generation System

Requirements Edition

Field	Detail
Document Owner	Shashank — IT Lead — scope covering growth, performance marketing and product
Company	Rehamo — Rehab & Mobility Experience Centre, Bengaluru
Version	1.0 — retrospective PRD, documented post-implementation
Status	Shipped — live and running
Timeline	June 2021 — ongoing
Stakeholders	Sales, clinical and referral partners, management

1. Executive Summary

Rehamo generated revenue through walk-ins and formal referral partnerships with physiotherapists and doctors. No digital acquisition channel existed: no ad spend had ever run, no conversion events were defined, GA4 was not meaningfully configured, and no internal traffic filter was in place — meaning the 500–1,000 monthly sessions recorded were inflated.

This document covers the creation of a digital acquisition channel from nothing: reframing the website from a store to the top of a consultative funnel, building the enquiry and measurement infrastructure in-house, and establishing closed-loop attribution against billing. Outcome: 400+ qualified leads per month within the first year, closing at ~25%, at 4–5x billing-matched ROAS.

2. Problem Statement

Problem
The business depended entirely on walk-ins and clinician referrals — a channel that grows only as fast as relationships with clinicians can be built. The website was structured as a store for a purchase nobody makes alone, had no conversion architecture, and no measurement. There was no way to acquire customers at a rate the business controlled.

2.1 Starting position

- Roughly 500–1,000 monthly sessions, inflated by unfiltered internal traffic.
- No conversion events defined anywhere on the site.
- GA4 present but not meaningfully configured; no usable historical data.
- No ad spend had ever been committed.
- All attributable revenue from walk-ins and referral partnerships.

2.2 The underlying question

Whether a digital lead could be worth as much as a clinician referral. A referred patient arrives pre-convinced by a trusted professional; a digital lead does not. Proposing spend meant arguing that a structurally weaker lead, at sufficient volume, would justify the cost. No prior attempt or internal data existed. The proposal was originated internally and supported with external evidence — category keyword search volume, and competitors sustaining paid ads and top rankings on those terms — with a deliberately small, stoppable initial ask.

2.3 Root cause of the conversion gap

The website was built on an ecommerce model in a category that does not buy that way. Mobility and respiratory equipment are high-consideration, often crisis-triggered purchases where the buyer is not the user and the cost of being wrong is high. Trust is the product — which is exactly what the referral network supplied and what the website did not.

2.4 Discovery signal

After baseline tracking was configured, Search Console showed impressions and clicks on product pages while GA showed a very high bounce rate — visitors were arriving and leaving. Conversations with inside sales, the store team and customers identified the cause: buyers wanted to consult an expert before purchase rather than check out directly.

3. Goals & Non-Goals

3.1 Goals

- Establish a digital acquisition channel that the business controls, independent of referral network growth.

- Reframe the website as the top of a consultative funnel rather than a store.
- Define and instrument a qualified enquiry as the conversion event, across every route customers actually use.
- Establish closed-loop attribution against billed revenue rather than platform-reported figures.
- Build organic search and local reputation as compounding owned channels.
- Produce leads that convert to sale at a rate that justifies the spend.

3.2 Non-Goals

- Full ecommerce checkout and payment — not the conversion model for this category.
- Replacing the referral network — digital was additive, not a substitute.
- Marketplace listings and social commerce.
- Mobile app development — web-first.
- CRM and lead management — covered in a separate PRD.

4. Target Users

Segment	Profile	Trigger & timeline	Job to be done
Primary — Family Caregiver	Adult child or spouse, 35–65, buying for an elderly parent or post-surgery family member	A fall or discharge summary. Days, sometimes hours.	Find a trusted expert who can confirm the right product for their situation
Secondary — Paediatric Parent	Parent, 28–45, of a child with a long-term condition	Growth — equipment outgrown every 12–18 months. Weeks.	Find a specialist who understands paediatric needs
Tertiary — Rental Seeker	Patient or caregiver, 30–60, short-term post-surgery need	Discharge instruction. Same day.	Get the right equipment quickly without buying it outright

5. User Stories

ID	User story	Acceptance criteria	Pri
US-1	As a caregiver, I want to contact Rehamo from any product page to ask whether a product suits my parent's condition.	WhatsApp and call CTAs above the fold on product pages; events tracked in GTM.	P0
US-2	As a caregiver, I want to submit an enquiry without a long form.	Custom React enquiry form, minimal fields, submitting to sales notification and dashboard.	P0
US-3	As a sales representative, I want to see new leads immediately rather than waiting for a report.	Admin dashboard showing enquiries on arrival; email notification per enquiry.	P0
US-4	As the business, I want every enquiry route counted, not just form fills.	Distinct conversion events for form, WhatsApp and call.	P0

ID	User story	Acceptance criteria	Pri
US-5	As the business, I want session data that excludes internal activity.	Internal traffic filter configured in GA4.	P0
US-6	As a visitor on mobile, I want pages to load quickly during an urgent search.	Mobile load under 3 seconds; Core Web Vitals passing on key templates.	P1
US-7	As a visitor searching for mobility products, I want to find Rehamo on Google.	Top commercial keyword clusters reaching Page 1 within 6 months.	P1
US-8	As a rental seeker, I want to raise a rental enquiry without navigating elsewhere.	Rental CTA and rental/purchase toggle on the enquiry form.	P1
US-9	As a paediatric parent, I want paediatric products presented separately.	Dedicated paediatric category with its own listings and content.	P2

6. Feature Requirements — Prioritised

Pri	Feature	Description	Rationale
P0	Measurement stack	GTM configured from scratch; conversion events per enquiry route; internal traffic filter in GA4	No measurement existed. Without it, spend cannot be evaluated.
P0	Enquiry form	Custom React form, minimal friction, on product and landing pages	The conversion event for a consultative funnel
P0	WhatsApp CTA	Direct-to-chat contact on product pages	The dominant contact channel in this category, well ahead of email
P0	Sales notification	Immediate email alert on every enquiry	Response speed is the competitive lever in an urgent, anxious purchase
P0	Admin dashboard	Custom-built lead visibility for the sales team	Leads visible on arrival rather than via a report
P0	Search campaigns	Category-structured Search campaigns; known intent only	Controllable and readable — you can see which query produced which enquiry
P1	Landing pages	Dedicated pages for high-intent keyword clusters with matching ad copy	Intent-to-page match; consultative offer present at arrival
P1	SEO programme	500+ target keywords, category content, internal linking	Owned channel, compounds, no marginal cost per click
P1	GMB and review programme	Profile optimisation plus systematic review generation	Trust substitute for clinician endorsement; pre-contact reassurance

Pri	Feature	Description	Rationale
P2	Rental landing page	Dedicated rental page and enquiry flow	Distinct job to be done with a hard end date

7. Measurement & Attribution Approach

Element	Detail
Conversion definition	A qualified enquiry, not a transaction — the category converts on a consultation, not a checkout.
Routes counted	Form submission, WhatsApp initiation, and phone call, each as a distinct event. Counting only form fills would materially undercount the channel.
Attribution model	Closed loop. Revenue from the billing system reconciled against CRM records and customer feedback.
Explicitly not used	Platform-reported ROAS. In a category with phone and WhatsApp enquiries and an offline close, the ad platform cannot observe most of the outcome.
Baseline correction	Internal traffic filter configured, which revised the session baseline downward from the previously reported 500–1,000/month.
Rollout approach	Consultative CTAs (WhatsApp, email, call) tested on a few product categories for a few weeks before site-wide rollout. Paid started Search-only on a small budget and scaled gradually on billing-matched results. No formal pre-set thresholds were used.
Known limitation	Tracking and spend went live in the same period. The first months of data were adequate for steering but not for learning, and cannot be re-measured.

8. Out of Scope

- Ecommerce checkout and payment gateway integration
- CRM and lead management — separate PRD
- Email marketing automation
- Social media content strategy
- Mobile app development
- Third-party marketplace listings

9. Technical Requirements

9.1 Build

- Custom React enquiry form integrated into the existing platform.
- WhatsApp deep-link CTA with event tracking.
- Email notification service triggered on enquiry submission.
- Custom admin dashboard (React/Node) for real-time lead visibility.

9.2 Measurement

- GTM container configured from scratch with triggers for all CTA clicks, form submissions, WhatsApp clicks and call clicks.
- GA4 conversion events defined per enquiry route.
- Internal traffic filter configured to exclude staff activity.
- Search Console linked for unified organic and paid visibility.
- Conversion import into Google Ads for bidding optimisation.

9.3 Performance and SEO

- Mobile load under 3 seconds; Core Web Vitals passing.
- Structured data: Product, FAQPage, LocalBusiness.
- Canonical tags, XML sitemap, priority-aligned internal linking.

10. Success Metrics

Metric	Baseline	Target	Actual
Lead-to-sale conversion	Not measured	>20%	~25%
Monthly digital leads	0	100+	400+ within year 1
ROAS (billing-matched)	No spend	3x+	4–5x
Conversion tracking	None	All enquiry routes	Form, WhatsApp, call
Internal traffic filtering	None	Configured	Configured
Page 1 keyword rankings	0	10+	100+ of 500+
GMB reviews	Minimal	500+	2,000+

Note on metric order: defining a qualified enquiry as the conversion inflates lead counts by definition. Lead-to-sale conversion is the metric that tests whether the model worked, particularly against a referral channel whose leads arrive pre-convinced.

11. Risks & Mitigations

Risk	Severity	Mitigation
Digital leads convert too poorly to justify spend against the referral channel	High	Measure lead-to-sale as the primary metric from the start. Reconcile against billing so the answer is real.
Spend committed before measurement is trustworthy	High	Realised risk. Tracking and spend went live together; the first months were steerable but not analysable.
Sales cannot absorb the follow-up load of a high-volume, lower-conviction channel	Medium	Realised. Immediate notification and dashboard built to reduce latency; drove subsequent case management work.
Automated channels spend budget	Medium	Search-only start. PMax trialled briefly and killed — its

Risk	Severity	Mitigation
without producing learnable data		learning period could not be justified without audience visibility. Shopping cut back significantly.
Platform-reported ROAS overstates performance and misleads allocation	Medium	Closed-loop reconciliation against billing adopted as the standard.
Digital cannibalises rather than adds to referral volume	Low	Monitor referral volume alongside digital; channels serve different trigger points.

12. Implementation Timeline

Phase	Timeline	Deliverables
Phase 1	Initial	Proposal built on keyword search volume and competitor ad activity. Small, stoppable budget approved.
Phase 2	Tracking & discovery	GTM, conversion events, internal traffic filter. High-bounce signal investigated with sales, store and customers; consultative model identified.
Phase 3	Test & build	Consultative CTAs tested on a few categories for a few weeks. On success: React enquiry form, WhatsApp CTA, notifications and admin dashboard rolled out site-wide.
Phase 4	Launch & scale	Search campaigns, category-structured, scaled gradually on billing-matched results.
Phase 5	Expansion	Landing pages for high-intent clusters. SEO programme. GMB and review programme.
Phase 6	Rationalisation	PMax trialled briefly and killed. Shopping cut back. Spend concentrated on Search.
Ongoing	—	Weekly performance review. Monthly billing reconciliation. Continuous SEO and campaign optimisation.

13. Open Questions

- Should landing pages and targeting segment by care situation — post-surgery, elderly care, paediatric — rather than by product category?
- Should rental customers be modelled as a recurring cohort rather than one-time acquisition? Current treatment likely understates the segment.
- Should lead outcome by source feed back into campaign allocation? Source is captured and revenue matched, but the loop is not closed.
- What is the true incremental contribution of digital, given some customers encounter both a referral and an ad?
- Accessibility has not been audited — a notable gap for a disability-adjacent product.

Published as a portfolio artefact. Commercial figures — revenue, ad spend and margin — are deliberately excluded. Retrospective document, written after implementation.
